

Exception Handling

Exceptions

- What happens when an error occurs?

Exception Types

- Syntax Error: A problem with our syntax, occurs before runtime
 - Sometimes a NameError occurs at this point as well

Exception Types

- Runtime Error: Gets raised if there is something wrong during python runtime
 - Usually syntactically correct, but an impossible operation was called

Exception Types

- Logical Error: Syntactically and functionally correct, but the outcome is not the intended outcome
 - Unexpected outcome
 - Not designed for state

Types of Errors - Common

- `SyntaxError`
- `TypeError`
- `ValueError`
- `KeyError`
- `EOFError`
- `IndexError`
- `NameError`
- `ZeroDivisionError`

Exception Handling

- We can attempt to manage what happens when an error occurs
- This is through exception handling

Exception Handling

- Try: attempts to run code
- Except: runs when the try block fails to execute without raising an error
- Else: runs only when the try block runs without error
- Finally: runs every time
